

Calibrated Narrative Coding

Stage 1 screens 10 presence questions over the random sample and sizes the Stage 2 frame: 150,000 random plus rare-class enrichment, every record carrying its inclusion probability

THE AUDIT DECIDES WHAT p MEANS

compared against both; fitted on the human labels alone, because the coded fields flatter the model

- question asked
- gate not opened
- coded CRIS label
- human label
- record a person opens
- p
- log scale, 0.001 to 1

fixed, never trained the only fitted object in the pipeline

\$0.155 per 1,000 · 0.20 s median · \$30 to code the 195,857 evaluated · \$779 to code all 5.02 M
